Engaging Learners with Good Course Design

(No Matter the Environment)

Understand Your Learners.

Knowing your students will help guide your course design.

Planning is Important.

When designing instruction it often helps to work backwards and think about how you will evaluate, implement, and develop materials, methods, and media that facilitate instruction.
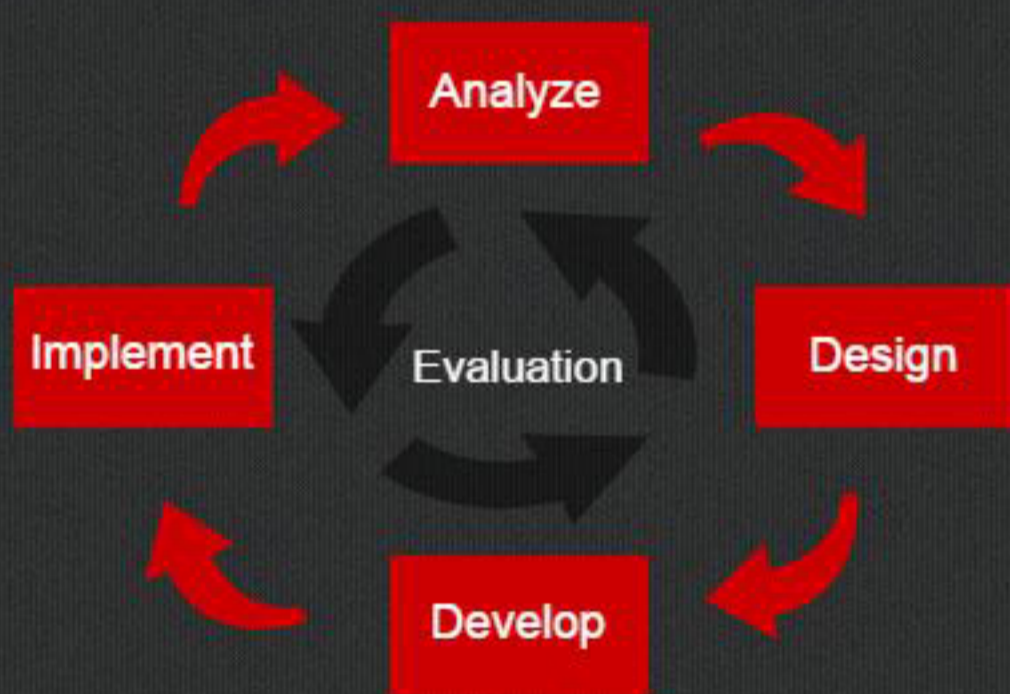

Use Active Learning

Move from a passive process to an active one through activities that are student-centered and participatory.

It all begins with Learning Objectives.

Should be measurable, use active verbs, and align with course goals.
